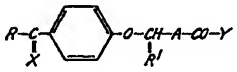
(72) Inventor ANDRÉ MIEVILLE

(54) SUBSTITUTED PHENOXY-ALKYL-CARBOXYLIC ACIDS AND DERIVATIVES THEREOF

(71) We, ORCHIMED S.A., a Swiss Body corporate of c/o Me. Gumy, 8 Bd. de Perolles, 1700 Fribourg, Switzerland, do hereby declare the invention, for which we pray that a patent may be granted to us, and the method by which it is to be performed, to be substantially described in and by the following statement:—

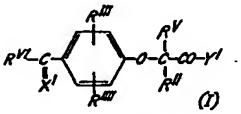
This invention concerns p-carbonyl-phenoxy-carboxylic acids and derivatives thereof which result from transforming the p-oxo radical into oxime, acid, ester and amide radicals and from transforming the carboxylic acid radical into ester and amide radicals.

Our copending Patent Application Number 3085/70 (1 268 321) claims compounds having the formula



where Y is —OH, —OCH_3, —OC_2H_5, —OC_3H_7, NHOH, NR_1R_2, A represents a single bond or a divalent straight- or branched-chain C_{1-3} hydrocarbon radical, R′ is a hydrogen atom or a phenyl group, and either X is = O or = NOH and R is a hydrogen atom or a phenyl, halophenyl, C_{1-3} alkyl, C_{1-3} ω-haloalkyl, and if X = O, R is hydroxyl, methoxy, ethoxy, propoxy, —NHOH or —NR_1R_2 group or R—CX represents a cyano group, each of R_1 and R_2 being a hydrogen atom or an alkyl or diethylamino alkyl group or R_1 and R_2 forming, together with the nitrogen atom to which they are attached, a substituted or unsubstituted heterocyclic group.

The present invention provides compounds having the general formula



(I)

but excluding those claimed in the said copending application, in which R′′ and R″ are identical or different and each represents H, CH_3, C_2H_5, C_6H_5, p—F—C_6H_4, p—Cl—C_6H_4, —R′′′ and R′′′′, which may be identical or different, represent H, a halogen atom, preferably F, Cl or Br, a C_{1-5} alkyl group, CF_3, SCH_3, $SOCH_3$, SO_2CH_3, OCH_3, OH or C_6H_5; R′′ represents H, a C_{1-5} alkyl group, an aryl group, an aryl group the aromatic residue of which is substituted by one or more CH_3, CF_3 or halogen atoms, a cycloalkyl group, OH, a C_{1-4} alkoxy group, an aryloxy

group, an aryloxy group the aromatic residue of which is substituted, a cycloalkyloxy group, a NR_3R_4 group, a $NHCH_2CH_2NR_3R_4$ group or an O-alkylene-NR_3R_4 group; Y′ represents OH, C_{1-4} alkoxy, NR_3R_4, $NHCH_2CH_2NR_3R_4$ or O-alkylene-NR_3R_4; X′ represents O or NOR_o; R_o represents H, C_{1-5} alkyl, $CH_2CH_2NR_3R_4$ or $CH_2CHOHCH_2OH$; and each of R_3 and R_4, which may be identical or different, represents a hydrogen atom, a C_{1-5} alkyl group, a C_{3-7} cycloalkyl group, preferably a C_{5-6} cycloalkyl group, an aryl group, an aryl group the aromatic residue of which is substituted by one or more halogen atoms or CF_3 or CH_3 groups, or R_3 and R_4 are joined to form, together with the nitrogen atom to which they are bonded, an optionally substituted 5- to 7-membered heterocyclic ring, which may contain a second hetero-atom selected from O, S and N, or radical of formula $-NH(CH_2)_4CH(NH_2)COOH$ or $-NHCH(COOH)CH_2SH$, with the provisos that if R‴ and R⁗ are not both hydrogen, then R^{VI} is methyl or *p*-chlorophenyl, and that if Y is hydroxy or alkoxy, R^{VI} is hydrogen or C_{1-5} alkyl and one of R″ and and R^V is hydrogen, the other of R″ R^V is methyl or ethyl.

This invention also concerns the acid-addition salts which can be formed from formula I compounds.

Compounds of formula I can be used as therapeutic agents, and act in particular on the central nervous system, or as anti-inflammatory or normolipemiant agents. Such compounds can be used in therapeutic medicines as analgesic, anti-inflammatory, psychotropic, cardiovascular, normolipemiant, hypocholesterolemiant or antitussive ingredients.

Consequently, the invention further provides a therapeutic composition containing at least one compound of the invention as an active ingredient in association with a pharmaceutically acceptable carrier, diluent or coating.

The term alkyl here means a straight or branched hydrocarbon chain. The term alkoxy means a straight or branched hydrocarbon chain which is bonded to an oxygen atom by a single bond. Among the alkoxy groups according to this invention, the following simplest ones can be mentioned: methoxy, ethoxy, propyloxy, isopropyloxy, butyloxy, isobutyloxy and tertiobutyloxy.

The preferred cycloalkyl groups are cyclopentyl, cyclohexyl and $\Delta^{1,2}$-cyclohexenyl. The preferred cycloalkyloxy groups are cyclopentyloxy, cyclohexyloxy and $\Delta^{1,2}$-cyclohexenyloxy.

The term "O-alkylene-NR_3R_4" which is also described as "aminoalkyloxy", represents a group consisting of a divalent straight or branched hydrocarbon chain which is between an oxygen atom and a NR_3R_4 group. Preferably the alkylene residue comprises from 1 to 6 carbon atoms. Among the preferred O-alkylene-NR_3R_4 groups the following ones can be mentioned: aminoethoxy, aminopropyloxy, aminoisopropyloxy, mono- and dialkylaminoethoxy, mono- and dialkylaminopropyloxy, mono- and dialkylaminoisopropyloxy, piperidinoethoxy, azepinoethoxy, morpholinoethoxy, piperazinoethoxy, N′-methylpiperazinoethoxy, pyrrolidinoethoxy, piperidinopropyloxy, piperidinoisopropyloxy, azepinopropyloxy, azepinoisopropyloxy, piperazinopropyloxy, piperazinoisopropyloxy, morpholinopropyloxy, morpholinoisopropyloxy, thiomorpholinopropyloxy, thiomorpholinoisopropyloxy, N′-*p*-chlorophenylpiperazinopropyloxy and N′-*p*-chlorophenylpiperazinoisopropyloxy.

Examples of groups represented by NR_3R_4 are amino, mono- and dialkylamino, morpholino, thiomorpholino, pyrrolidino, piperidino, azepino, N-*p*-chlorophenylpiperazino, N- methylpiperazino, piperazino, 4-methylpiperidino, anilino, N-methylanilino, 2,3-dimethyl anilino, *p*-chloranilino, O-trifluoromethylanilino, *p*-trifluoromethyl anilino, cyclohexylamino and cyclopentylamino groups and analogues thereof.

The preferred halogen atoms are fluorine, chlorine and bromine.

The aryl group of R⁗, R^{VI}, R_3 and R_4 can be substituted by one or more F, Cl, Br, CF_3 and CH_3. The preferred ones according to this invention are phenyl, *p*-chlorophenyl and *p*-fluorophenyl.

Among the compounds corresponding to formula I two kinds of products can be distinguished:

1) the *p*-carbonyl-phenoxy-alkyl-carboxylic acids and derivatives thereof which result

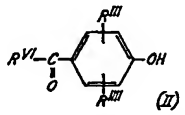
a) from transforming the *p*-oxo group into oxime X = NOR_o,
b) from transforming the carboxylic acid group into ester and amide groups, and,
c) from transforming both the *p*-oxo group into oxime and the carboxylic acid groups into ester and amide groups; and,

2) the *p*-carboxy-phenoxy-alkyl-carboxylic acids, hereafter called "diacids" and derivatives thereof which result from the transformation of one or the both carboxylic acid groups into ester and amide groups.

Among the compounds of the "*p*-carbonyl" type, R^{VI} represents H, C_1—C_6 alkyl, aryl preferably C_6H_5, *p*—Cl—C_6H_4 and *p*—F—C_6H_4.

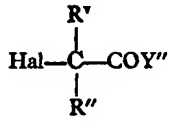
Among the "diacid" type R^{VI} represents OH, C_1—C_6 alkoxy, aryloxy preferably phenoxy and *p*-chlorophenoxy, cycloalkyloxy preferably cyclopentyloxy, cyclohexyloxy, $\Delta^{1,2}$-cyclohexenyloxy, NR_3R_4, $NHCH_2CH_2NR_3R_4$, or O-alkylene-NR_3R_4.

The *para*-carbonyl compounds of formula I in which X′ is an oxygen atom and Y′ is a hydroxy group or a C_{1-3} alkoxy group may be prepared by reacting a *para*-hydroxybenzoyl compound of the formula



(II)

in which R^{VI}, R‴ and R⁗ are defined as above with a halogen compound of the formula



(III)

in which Hal represents a halogen atom, Y″ is a hydroxy group or a C_{1-3} alkoxy group and R^V and R″ are as defined above, in an alkaline medium.

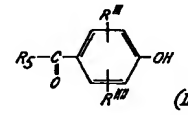
The carbonyl function >C=O may be converted into an oxime function or an ester or other ester or an amide function respectively, using a method known *per-se* for converting a carbonyl function to an oxime function or for converting a carboxylic or C_{1-3} alkoxy ester function to an ester, other ester or amide function.

The following procedures may be used to prepare the compounds of formula I:

PROCEDURE A.

Preparation of acids, esters and amides of formula I, in which R″ is a hydrogen atom and X′ is an oxygen atom

a) A *p*-hydroxybenzoyl derivative having the formula



(IIa)

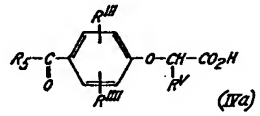
in which R_5 is a hydrogen atom or an alkyl or aryl group, particularly a *p*-chlorophenyl group, is reacted with an α-halogenated acid for the formula

$$R^V—CH(Cl)—CO_2H \qquad \text{(IIIa)}$$

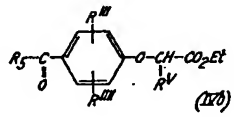
or an α-halogenated ester of the formula

$$R^V—CH(Br)—CO_2Et \qquad \text{(IIIb)}$$

in order to obtain respectively a compound of the formula



(IVa)



(IVb)

b) When R_5 represents a hydrogen atom or an alkyl group, compound IVa may be esterefied using methyl or ethyl alcohol; the ester obtained may be condensed with an appropriate amine to produce a desired amide of formula I, or transesterified to synthesize an ester of formula I other than those already mentioned in procedures A (a) and A (b).

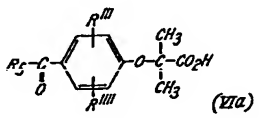
c) When R_5 represents an aryl radical, compound IVa may be converted by means of $SOCl_2$ or PCl_5 into the corresponding acid chloride which may be reacted with an appropriate amine, alcohol or amino alcohol, in accordance with a method known *per se*, in order to obtain respectively a desired amide, ester or amino ester of formula I.

d) Compound IVb may be condensed with an appropriate amine in accordance with a method known *per se* to produce a desired amide of formula I or compound IVb may be transesterified to prepare other esters of formula I.

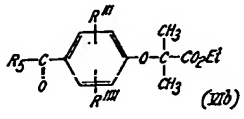
PROCEDURE A,

Preparation of acids, esters and amides of formula I in which $R^V = R'' = CH_3$ and $X' = O$

a) An acetone-chloroform mixture or an α-halogenated ester of the formula $Br—C(CH_3)_2—CO_2Et$ (V), is reacted with compound IIa in an alkaline medium, in order to obtain respectively a compound of the formula



(VIa)



(VIb)

b) Compound VIa can be esterified by means of a lower alcohol, for instance to give methyl, ethyl or iso-propyl ester, particularly when R_5 is an alkyl group.

c) Ester VIb can be amidified or transesterified, in accordance with methods known *per se* to produce respectively an amide or other ester of the formula I.

d) When R_5 is an aryl group, compound VIa may be converted into the corresponding acid chloride by means of $SOCl_2$ or PCl_5 and then, if desired, the acid chloride may be reacted with an appropriate amine, alcohol or amino-alcohol to produce an amide, ester or amino ester respectively of the formula I.

PROCEDURE B.

Preparation of aldoximes and ketoximes of formula I, i.e. compounds of formula I in which $X' = NOH$ or NOR_o.

a) The compounds of formula I in which $X' = NOH$ may be prepared by treating corresponding compounds of the formula I in which $X' = O$ with hydroxylamine hydrochloride in a basic medium, preferably a pyridinic medium.

b) The compounds of the formula I in which $X' = NOR_o$ may be prepared:— by condensing corresponding compounds of the formula I in which $X' = O$ in a basic (pyridine) medium, with a substituted hydroxylamine hydrochloride, such as:

$$H_2N—O—R_o, HCl,$$

from the compound of the formula I, in which $X' = NOH$, by the following reactions:

$$—NOH \xrightarrow[t.Bu\ OK]{} —NOK \xrightarrow[X\ R_o]{} —NOR_o$$

The following examples are given to illustrate the invention and analogous methods of preparing compounds in accordance with the invention.

EXAMPLE 1.

4-(*p*-chlorobenzoyl)-phenoxy-acetic acid

a) *Preparation of 4-hydroxy-4'-chlorobenzophenone*

Phenol and *p*-chlorobenzoyl chloride are successively added at 0°C to a solution of $AlCl_3$ in nitrobenzene (or a suspension of $AlCl_3$ in ligroine or dichloroethylene); the resulting mixture is kept warm to 25°C for 17 hours, and hydrolysed; 4-hydroxy-4'-chlorobenzophenone is then isolated by extraction using dilute sodium hydroxide and washing with hexane.

b) *4-(p-chlorobenzoyl)-phenoxyacetic acid*

A mixture of 1 mole of 4-hydroxy-4'-chlorobenzophenone, 2.2 moles of NaOH, 1.2 moles of $ClCH_2—CO_2H$ and 1300 cc of water, is refluxed for 7 hours.

After acidification and extraction with $NaHCO_3$ have been conducted and followed by a second acidification, 4-(*p*-chlorobenzoyl)-phenoxyacetic acid is isolated. Its melting point is 152°C.

EXAMPLE 2.

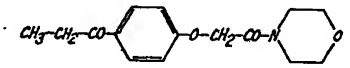
N-(*p*-propionyl-phenoxyacetyl)-morpholine.

This example illustrates the procedures A(b) and A(d) described above.

a) *Methyl p-propionyl-phenoxyacetate*

1 mole of *p*-propionyl-phenoxyacetic acid is refluxed during 10 hours, with 100 cc of MeOH and 300 cc of $CHCl_3$ or CH_2Cl_2 in the presence of sulfuric acid. The resulting mixture is poured into water. The desired ester remains in the organic phase. It is washed once with dilute NaOH, then twice with water. Pure methyl *p*-propionyl-phenoxyacetate is thus isolated, with a yield of about 90%. MP: 59°C.

b)



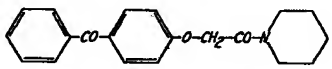
1 mole of the ester obtained in step (a) is refluxed for 8 hours with 2.5 moles of morpholine. Then, 1 volume of water is added, and the product is left to crystallize in the cold state. The morpholinic amide is filtered off and recrystallized from alcohol (yield: 85%; melting point: 88°C).

By using the procedure described in example 2, original compounds listed in table III are prepared.

EXAMPLE 3.

N-(*p*-benzoylphenoxyacetyl)-piperidine

This example illustrates procedure A (c) described above

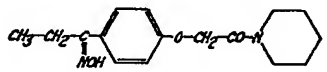


The piperidinoamide of *p*-benzoylphenoxy acetic acid is obtained by treating 1 mole of *p*-benzoylphenoxy acetic acid chloride with 2 moles of piperidine in benzene.

By using the procedure described in example 3, original compounds listed in table IV are obtained.

EXAMPLE 4.

Para-propionhydroximoyl- phenoxy-acetyl-1-piperidine

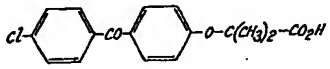


1 mole of *p*-propionylphenoxyacetyl-1-piperidine is refluxed for 5 hours with 1.1 mole of $NH_2OH.HCl$ and 1.05 mole of pyridine. The desired oxime is precipitated in water and recrystallized from alcohol. Its melting point is 144°C.

By using the procedure described in example 4, original compounds listed in table V are obtained.

EXAMPLE 5.

Preparation of para-(4-chlorobenzoyl)-phenoxy-isobutyric acid



1 mole of 4-hydroxy-4'-chlorobenzophenone is dissolved in anhydrous acetone and then 5 moles of powdered sodium hydroxide is added. The corresponding sodium phenate precipitates. Refluxing is effected, and then, 1,5 mole of $CHCl_3$ diluted with anhydrous acetone is added and the resulting mixture is refluxed for 10 hours. After cooling, water is added, the acetone is evaporated, the aqueous phase is washed with ether and acidified and the organic phase is re-dissolved in ether and extracted into a solution of bicarbonate. The bicarbonate solution is then acidified to obtain the desired acid, having a melting point of 185°C, with a yield of 75%.

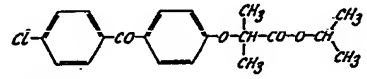
By using the procedure described in example 5, original compounds listed in table VI are prepared.

Esters and amides of the phenoxy-isobutyric acids prepared in accordance with the procedure of example 5 are produced in accordance with procedure A_1 described above. Esters and amides prepared in this manner are listed in table VII.

The compounds listed in table VII can be prepared in a manner similar to that described in the following example.

EXAMPLE 6.

Iso-propyl p-(4-chlorobenzoyl)-phenoxy-isobutyrate



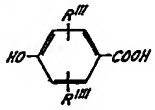
(Code No. 178)

1 mole of the acid obtained in example 6 is converted into its acid chloride using thionyl chloride (2,5 moles). 1 mole of the acid chloride is then condensed with 1,05 mole of isopropyl alcohol in the presence of 0,98 mole of pyridine in an inert solvent such as benzene.

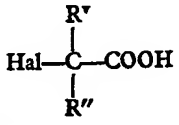
Since traces of SO_2 (which has a bad smell) may be obtained from the thionyl chloride; it is preferable to avoid this disadvantage by carrying out the esterification directly.

Using procedure B described above, isobutyric acids, and esters and amides thereof prepared in example 5 are connected to the corresponding oxime compounds listed in table VIII.

The compounds of formula I in which R^{VI} and Y' are both hydroxy groups may be prepared in accordance with the invention by a) reacting *p*-hydroxybenzoic acid which has the formula



with a halogeno carboxylic acid having the formula

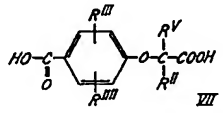


in which Hal represents a halogen atom in an aqueous alkaline medium under reflux, and b) precipitating the resulting diacid in an acidic medium.

It is preferred to use one mole of *p*-hydroxy benzoic acid per mole of the halogeno carboxylic acid.

The compounds of formula I in which at least one of R^{VI} and Y' is other than hydroxyl can be prepared in accordance with the invention by converting at least one of the acid functions of the diacid into an ester or amide function by a method known *per-se* for converting carboxylic acid groups to ester or amide groups.

The diacid, which has the formula



VII

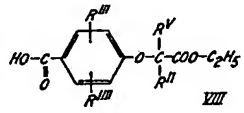
can be used directly:

a) for the synthesis of a diester of the invention in which $R^{VI} = Y'$,

b) to prepare an intermediary acid dichloride for which a diester or a diamide of the invention in which $R^{VI} = Y'$ can be synthesized, or

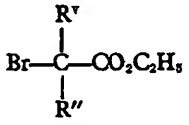
c) for the synthesis of a monoester of the invention; in this case the acid function carried by the oxyacetic chain, i.e. the group $OCR^{V}R''COOH$, is esterified through the acid monochloride prepared with PCl_5 in C_6H_6 at 0°C.

The monoesters of the formula

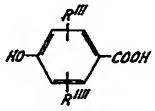


VIII

can be synthesized in accordance with method c) or else by the action of ethyl bromoacetate:

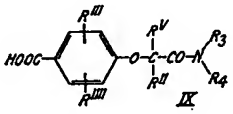


on a *para*-carboxy-hydroxyphenone of the formula



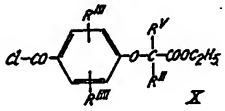
in a heterogenous alkaline medium.

From the monoesters of the invention, particularly those of formula VIII above, there can be obtained, by using a method known *per-se*, monoamides of the invention, e.g. of the formula



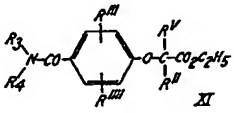
IX

or acid monochlorides, e.g. of the formula



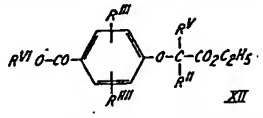
X

The acid monochlorides can in turn be converted into symmetrical and asymmetrical diesters and amide-esters of the invention, e.g. of the formula



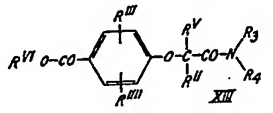
XI

Finally, a symmetrical or asymmetrical diester of the invention, e.g. of the formula



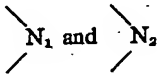
XII

can be converted to an amide ester of the invention, e.g. of the formula

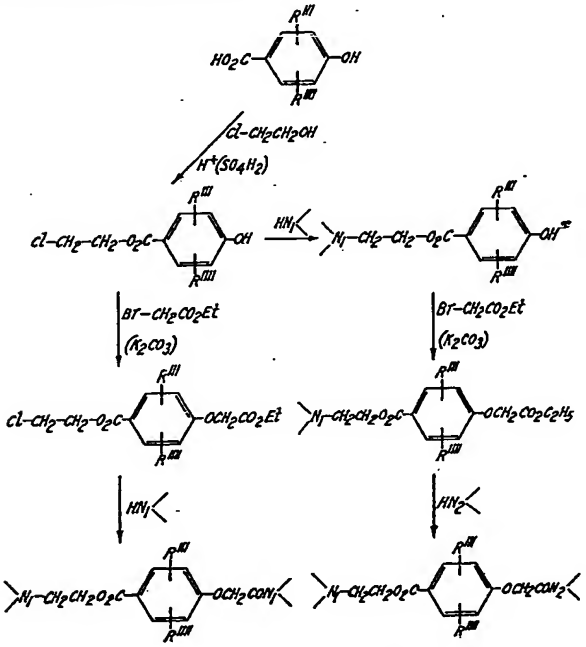


XIII

By a simple modification of the reaction sequences described above it is possible to obtain the compounds of the invention in which one of R^{VI} CO— and —COY′ is an amino-ester group and the other of R^{VI} CO— and —COY is an amide group, any substituents on the nitrogen atom of the amino-ester group being identical to or different from those on the nitrogen atom of the amide group. This is illustrated in the following reaction scheme in which

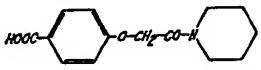


represent non-identical amino groups.



The following examples are given to illustrate the invention.

EXAMPLE 8.
N-(*p*-carboxyphenoxy-acetyl)piperidine

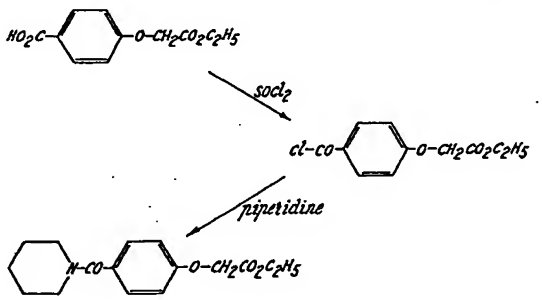


A mixture of 1 mole of ethyl *p*-carboxy-phenoxy-acetate and 2,5 moles of piperidine is refluxed for 7 hours. Water is then added, and 1-*p*-carboxy-phenoxy-acetyl piperidine precipitates.

EXAMPLE 9.

Ethyl para-piperidinocarbonyl-phenoxy-acetate

Operation is in accordance with the following reaction scheme:



The amide ester product can be reacted with any amine, in accordance with the procedure described in Example 8, to produce a diamide.

The substances indicated in Tables I and II are prepared in accordance with the procedure described in Example 8 or Example 9.

The substances listed in Table I bis have been found to possess anti-tussive and analgesic properties.

The following Examples illustrate particular procedures for preparing the compounds number 96 and 99 appearing in Tables I and II respectively.

EXAMPLE 10.

N-(*p*-carboxyphenoxy-acetyl)-piperidine coded as No. 96

a) *Ethyl p-carboxyphenoxy-acetate*

1 mole of ethyl bromoacetate is reacted with 1 mole of *p*-hydroxybenzoic acid in the presence of 2 moles of K_2CO_3 in acetone, methyl-ethylketone, dioxan or tetra-hydrofuran, for 48 hours, at the reflux temperature of the organic solvent to obtain ethyl *p*-carboxyphenoxy-acetate.

b) *N-(p-carboxy-phenoxy-acetyl)piperidine*

The preceding ester (1 mole) is heated under reflux with piperidine (3 moles) in a chlorinated solvent, for 6 hours. Water is added to precipitate N-(*p*-carboxy-phenoxy-acetyl)piperidine after condensation is complete.

EXAMPLE 11.

N-(*p*-ethoxycarbonyl-phenoxy-acetyl)piperidine coded as No. 99

Ethyl *p*-carboxy-phenoxy-acetate is esterified in ethanol and chloroform in the presence of sulphuric acid. N-(*p*-ethoxycarbonyl-phenoxy-acetyl)piperidine is obtained by condensation of 1 mole of the resulting diester (ethyl *p*-ethoxycarbonyl-phenoxy-acetate) with 3 moles of piperidine in an inert solvent for 7 hours at the boiling temperature of said solvent.

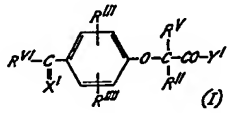
We make no claim to the compounds claimed in the specification of our prior co-pending Application No. 3085/70 (1,268,321), which are defined at the beginning of the specification. Subject to this disclaimer,

WHAT WE CLAIM IS:—

1. A phenoxy-alkyl-carboxylic compound of the general formula:



(I)

in which each of R″ and R^{v}, which may be identical or different, is a hydrogen atom or a methyl, ethyl, phenyl, *p*-chlorophenyl or *p*-fluorophenyl group; each of R‴ and R⁗, which may be identical or different, is a hydrogen or halogen atom or a C_{1-5} alkyl, CF_3, SCH_3, $SOCH_3$, SO_2CH_3, OCH_3, OH, C_6H_5 or substituted phenyl group; R^{vi} is a hydrogen atom, a C_{1-5} alkyl group, an aryl group optionally containing one or more nuclear substituents selected from methyl and trifluoromethyl groups and halogen atoms, a cycloalkyl, hydroxyl or C_{1-4} alkoxy group, an aryloxy group optionally containing one or more nuclear substituents, or a cycloalkoxy, cycloalkenyloxy, NR_3R_4, $NHCH_2CH_2NR_3R_4$ or O-alkylene-NR_3R_4 group; Y′ is a hydroxy, C_{1-4} alkoxy, $—NR_3R_4$, $—NHCH_2CH_2NR_3R_4$ or O-alkylene-NR_3R_4 group; X′ represents O or NOR_6; R_6 is a hydrogen atom or a C_{1-5} alkyl, $—CH_2CH_2NR_3R_4$ or $—CH_2CHOHCH_2OH$ group; and each of R_3 and R_4, which may be identical or different, is a hydrogen atom, a C_{1-5} alkyl or C_{3-7} cycloalkyl group or an aryl group optionally containing one or more nuclear substituents selected from halogen atoms and methyl and trifluoromethyl groups, or R_3 and R_4 together with the nitrogen atom to which they are attached represent an optionally substituted 5- to 7-membered heterocyclic ring which may contain a second heteroatom selected from O, S and N, or radical of formula $—NH(CH_2)_4CH(NH_2)COOH$ or —NH—CH(COOH)—CH_2SH, with the provisos that if R‴ and R⁗ are not both hydrogen, then R^{vi} is methyl or *p*-chlorophenyl, and that if Y′ is hydroxy or alkoxy, R^{vi} is hydrogen or C_{1-6} alkyl and one of R″ and R^{v} is hydrogen, the other of R″ and R^{v} is methyl or ethyl.

2. A compound according to Claim 1, in which each of R″ and R^{v} is a hydrogen atom or a methyl or phenyl group, each of R‴ and R⁗ is a hydrogen or chlorine atom or a methyl, trifluoromethyl or methoxy group, R^{vi} is a straight- or branched-chain C_{1-6} alkoxy group or a hydroxyl, amino, monoalkylamino, di(C_{1-5} alkyl)amino, piperidino, morpholino, azepino, pyrrolidino, piperazino, N′-*p*-chlorophenylpiperazino, aminoalkoxy, mono- or dialkylaminoalkoxy, piperidino alkoxy, morpholinoalkoxy, azepinoalkoxy, piperazinoalkoxy, aryloxy, *p*-chlorophenoxy cyclohexyloxy, Δ^1-cyclohexenyloxy, or $NHCH_2CH_2NR_3R_4$ group; Y′ is a hydroxyl, C_{1-4} alkoxy, NR_3R_4, $—NHCH_2CH_2NR_3R_4$, O—C_{1-6} alkylene-NR_3R_4 or cycloalkylamino group or an arylamino group optionally containing one or more nuclear substituents selected from chlorine atoms and methyl and trifluoromethyl groups; X′ represents O, and either each of R_3 and R_4 is a hydrogen atom or a C_{1-5} alkyl group, or R_3 and R_4, together with the nitrogen atom to which they are attached, represent an optionally substituted 5- to 7- membered heterocyclic ring, which may contain a second heteroatom selected from O, S and N, or radical of formula $NH(CH_2)_4CH(NH_2)COOH$ or —NH—CH(COOH)—CH_2SH.

3. A compound according to Claim 2, in which R^{vi} is a phenoxy group.

4. A compound according to Claim 1, in which each of R″ and R^{v} is a hydrogen atom or a methyl or phenyl group, each of R‴ and R⁗ is a hydrogen or chlorine atom or a methyl, trifluoromethyl or methoxy group, R^{vi} is a hydrogen atom, a straight- or branched-chain C_{1-5} alkyl group, or an aryl, *p*-chlorophenyl, cyclohexyl or Δ^1-cyclohexenyl group, Y′ is a hydroxyl, C_{1-4} alkoxy, $—NR_3R_4$, $—NHCH_2CH_2NR_3R_4$, O—C_{1-4} alkylene-NR_3R_4 or cycloalkylamino group or an arylamino group optionally containing one or more nuclear substituents selected from chlorine atoms and methyl and trifluoromethyl groups, R_6 is a hydrogen atom or a C_{1-5} alkyl or $CH_2CH_2NR_3R_4$ group, and R_3 and R_4 are as defined in Claim 2, with the provisos set forth in Claim 1.

5. A compound according to claim 4, in which R″ is a phenyl group.

6. A compound according to claim 1, in which each of R‴ and R⁗ is a fluorine, chlorine or bromine atom.

7. A compound according to Claim 1 or 6, in which Y′ is a C_{1-4} alkoxy group.

8. A compound according to claim 1, 6 or 7, in which R_6 is a C_{1-5} alkyl group.

9. A compound according to claim 1, 6, 7 or 8, in which NR_3R_4 is amino, mono- or dialkylamino, morpholino, thiomorpholino, pyrrolidino, piperidino, azepino, piperazino, N-*p*-chlorophenyl-piperazino, N-methylpiperazino, 4-methylpiperidino, anilino, 2,3-dimethylanilino, *p*-chloroanilino, O-trifluoromethylanilino, *p*-trifluoromethylanilino, cyclohexylamino, cyclopentylamino or N-methylanilino.

10. N-(*p*-propionyl-phenoxyacetyl)-morpholine.

11. N-(*p*-benzoyl-phenoxyacetyl)-piperidine.

12. N-(*p*-propionhydroximoyl-phenoxyacetyl)-piperidine.

13. Isopropyl *p*-(4-chlorobenzoyl)-phenoxy-isobutyrate.

14. *p*-(4-chlorobenzoyl)-phenoxy-isobutyric acid.

15. N-(*p*-carboxyphenoxy-acetyl)-piperidine.

16. Ethyl *p*-piperidinocarbonyl-phenoxy-acetate.

17. N-(*p*-ethoxycarbonyl-phenoxy-acetyl)-piperidine.

18. An acid addition salt of a compound according to any one of claims 1—9.

19. A compound according to claim 1 or 18 substantially as hereinbefore described.

20. A therapeutical composition comprising a pharmaceutically effective amount of at least one compound according to any one of claims 1, 6—9, 18 and 19.

21. A therapeutical composition comprising a pharmaceutically effective amount of at least one compound according to any one of claims 2, 3 and 15—17.

22. A therapeutical composition comprising a pharmaceutically effective amount of at least one compound according to any one of claims 4, 5 and 10—14.
